

Update #10 - District Student by Strand and School Student by Strand databases added to Generate Reports

June 2008

We have added two databases for **Students by Strand** (in addition to **Division Students by Strand Database**).

1. School Students by Strand Database generates a .CSV file by student for all students in a particular school by test. It includes each student's mark (number correct and % correct) for each strand. We have also added demographic data (**Gender, Aboriginal, ESL**). Principals can use this database to see how each student in a particular test is doing.

2. District Students by Strand Database generates a .CSV file by student for all students in the entire district by test. It includes each student's mark (number correct and % correct) for each strand. We have also added demographic data (**School, Gender, Aboriginal, ESL**). District office staff can use this database to see how each student in a particular test is doing.

Note that the outputs are .CSV files which can be saved as .XLS files. Users typically bring data from other sources to add to these databases to obtain an overall view of each student's progress.

You can generate these databases 'retroactively' - i.e. you can run them on existing / historical data. To generate one of these databases, open the **Report Type:** dialogue box and select it from the list under **Databases**.
